

Crito Voice AI

PRODUCT DOCUMENTATION

Everything You Can Do With Crito Voice AI

A plain-English guide to your AI phone system

? What Is Crito Voice AI?

Crito Voice AI is your always-on phone assistant. It answers incoming calls, speaks to your customers naturally, takes real actions during the conversation (like checking orders or booking appointments), and sends you a tidy written summary when the call is over. No staff needed for the phones.

Who Is It For?

Businesses	Any company that receives phone calls and wants them handled automatically and professionally.
Teams	Invite your staff, assign them the right level of access, and keep everyone informed.
Managers	Track every call, listen to recordings, read AI-written summaries, and see performance charts.

How a Call Works

Core Features

Answers Every Incoming Call

Crito picks up every call around the clock, every day of the year. No missed calls, no voicemail piles up, and no customer is left waiting.

Speaks Multiple Languages

Customers can call in their own language and the AI understands them. Spanish, French, Arabic, Urdu and more are all supported automatically.

Choice of Voice

Pick a voice that suits your brand from a library of natural-sounding AI voices. Calm and professional, warm and friendly, or confident and clear.

Works Around Your Hours

Set the days and times your business operates. Outside those hours the AI handles calls differently, such as taking a message or offering a callback.

Takes Real Actions During a Call

The AI does not just talk. It can look up an order, check availability, create a record or find a booking all while the customer is still on the line.

Sends a Summary Email After Each Call

Once a call ends, Crito automatically emails you a written summary covering what was discussed, what was done and any important points to follow up on.

Saves Every Call for Review

Each call is stored with the full transcript, the audio recording, the duration and an AI-generated analysis. You can search and replay any call at any time.

Shows Call Analytics

A visual dashboard shows call volumes, average durations, busiest times and how well the AI is performing, all in clear charts you can filter by date.

c

Smart Caller Recognition

Crito goes further than just answering calls. It tries to recognise who is calling before the conversation even starts, and it is trained to understand names, booking numbers and other details that speech recognition often gets wrong.

Who Is Calling? (Pre-Identified Caller)

When a call comes in, Crito immediately checks the caller's phone number against your records. If it finds a match, the AI already knows who the caller probably is before saying a word.

How it works	The system checks the incoming number against your contact database. If one person matches, the AI greets them by name and skips unnecessary questions. If more than one person could match, the AI asks a short clarifying question, such as confirming a date or booking number, to identify the right person quickly.
What this means for you	Calls are shorter because the AI does not ask for details it already has. Customers feel recognised rather than processed. The whole experience feels personal and professional from the very first word.

Understanding Names and Booking Numbers (Vocabulary)

Spoken words are not always easy to transcribe accurately, especially unusual names or long booking reference numbers. Crito uses a vocabulary list loaded before each call to help the AI get these right.

How it works	Before the call starts, the system loads a list of known names, booking identifiers and other terms specific to your business. If speech recognition picks up something unclear, the AI compares it against this list and selects the closest match.
What this means for you	Fewer misunderstandings when customers say their name or reference number. The AI picks the right record even when the audio is not perfectly clear. Conversations flow smoothly without the AI asking the customer to repeat themselves multiple times.

A

Setting Up Your AI Agent

You can fully control how your AI assistant behaves on every call. There is no coding involved. You simply fill in a settings form and save.

Welcome Message	The first thing the AI says when a customer calls. Write it to match your brand and tone.
General Context	Tell the AI about your business: what you do, your typical customers, your policies and your preferred communication style. The more detail you provide, the better it performs.
Operating Mode	Choose how the AI behaves: always on, restricted to business hours, or under manual control.
Business Hours	Set the exact days and times you are open. The AI adjusts its behaviour automatically outside those hours.
Phone Numbers	Assign your main number, a backup number for when the AI cannot handle something, and a transfer number to pass calls to a human when needed.
Caller Options and Tools	Choose which tools and topics the AI is allowed to use during a call, so you stay in full control of what it can offer each customer.

c

Tools and External Connections

This is where Crito goes beyond a standard phone system. You can connect it to other software so the AI can look things up or take actions during a live call.

What Is a Tool?

A tool is a connection to another system, such as your customer database, booking platform, order management system or any web-based service. During a call, the AI uses these tools to retrieve or create information in real time.

Example

A customer asks where their order is. The AI uses a tool to check your order system and reads the current status back to the customer, live on the call, without any human involvement.

What Is a Credential?

A credential is the secure key or password that allows Crito to access your external system. It is stored safely inside the platform and is never shared with callers. Crito supports four standard connection types: API Key, Bearer Token, OAuth 2 and Basic Auth.

Test Before Going Live

You can run a test of any tool directly inside the platform before it goes live. This confirms it works correctly before any real customer calls use it.

Connection Types Supported

API Key	A unique code that proves Crito is allowed to access your service.
Bearer Token	A secure token sent with each request to confirm identity.
OAuth 2	An industry-standard login method used by services like Google and Facebook.
Basic Auth	A straightforward username and password for simpler or older systems.

D

Dashboard and Call Records

Everything that happens on Crito is recorded and made available to you in clear, easy-to-read dashboards. You always know what is happening with your calls.

Your Dashboard

Total Calls	See exactly how many calls have come in across any time period you choose.
Total Duration	View the combined length of all calls handled by the AI.
Average Duration	Understand how long a typical call lasts so you can spot patterns.
Active Tools	See at a glance which connections to external systems are currently in use.
Team Members	A quick count of how many admins and users are active in your workspace.
Call Chart	A visual chart showing when calls happen throughout the day or week.

Call Logs

Full Transcript	Read the exact conversation word for word, formatted clearly.
Audio Recording	Listen to the call recording directly from the platform.
AI Summary	A short written summary of what was discussed and what happened.
AI Analysis	The AI rates the call quality and flags anything worth reviewing.
Cost and Duration	See how long each call was and what it cost.
Date Filters	Search by date range to find any call quickly.
Delete a Call	Admins and Super Admins can permanently remove a call record.

T

Team Management and Access

Crito lets you build your team inside the platform. You control who can join, what they can see and what they are allowed to do.

Invite by Email	Send a sign-up link to any team member. They click, set a password and they are in.
Assign Roles	Choose whether someone is an Admin with full access or a User with view-only access.
Change Roles	Promote or change a member's role at any time. The change takes effect immediately.
Activate or Deactivate	Suspend a member's access temporarily without deleting their account.
Remove Members	Permanently remove someone from your workspace with one click.
Cancel Invitations	Sent a link to the wrong person? Cancel it before they accept.

Who Can Do What

Super Admin	Admin	User
Oversee all workspaces	Manage team members	View the dashboard
Platform-wide statistics	Configure the AI agent	Browse call logs
Create or delete workspaces	View all call logs	View own profile
Copy workspace settings	Delete call records	Cannot delete calls
Delete any call record	Manage tools and credentials	Cannot manage team
Full access to everything	Edit workspace settings	Cannot change settings

I Integrations

Crito Voice AI is powered by a set of well-established services working together behind the scenes. You do not need to manage any of them directly.

Twilio
The phone network layer. When a customer dials your number, Twilio is the service that receives the call and passes it to the Crito AI. Think of it as the telephone line powering your number.

OpenAI (Custom Language Model)
The brain of the system. OpenAI provides the technology that understands what a caller is saying and decides what to say back. Crito uses a custom version configured specifically for your business.

Retell
The real-time voice layer. Retell connects the AI brain to the live phone call and handles the audio stream so the conversation feels natural and responsive with very little delay.

Automated Notifications (Webhooks)
Automatic signals that fire when something happens, such as a call starting or ending. They keep all connected systems in sync without any manual work from your team.

Custom System Connections
Any business software that has a web interface can be connected to Crito as a Tool. Your database, your CRM, your booking platform or your online store can all be reached by the AI during a live call.

The Call Path at a Glance

s

Security and Account Management

Crito is built with security as a priority. Your data, your calls and your team access are all protected by industry-standard measures.

Account and Sign-In

Sign Up and Log In	Standard email and password login. Simple, familiar and secure.
Forgot Password	Click Forgot Password, enter your email and receive a reset link straight away.
Password Reset	Follow the link to choose a new password. The link expires quickly to keep your account safe.
Invitation Onboarding	When you invite a team member they receive a unique link to create their account. No extra steps needed on your end.
Session Security	Your login session is protected by an encrypted token that refreshes automatically to keep you signed in safely.

Built-In Security

Role-Based Access	Each user can only see and do what their role allows. Users cannot access admin tools.
Verified Webhooks	Incoming signals from phone systems are checked to confirm they are genuine, not fake.
Request Limits	The system automatically limits repeated or suspicious requests to protect against misuse.
Input Checks	All information submitted through forms is validated before being processed.
Secure Credentials	API keys and passwords stored in Crito are encrypted and never visible after saving.
Health Monitoring	The system continuously checks that all components are running correctly and flags issues early.

Platform Administration
For Super Admins managing multiple organisations

If you are running Crito for more than one organisation or client, the Super Admin area gives you a single place to oversee everything across all of them.

Platform Dashboard	See total calls, total duration, number of active organisations and total users all in one view.
Manage Organisations	Create, activate, deactivate or permanently delete any client workspace.
Organisation Detail	Click into any organisation to review their call history, statistics and current settings.
Platform-Wide Call Data	Access call logs and analytics across all organisations from a single unified view.
Settings Visibility	Review any organisation's agent setup, tools and team without needing to log in as them.

Copying an Existing Workspace (Tenant Duplication)

If you are setting up a new client that is similar to an existing one, you can copy the existing workspace instead of starting from scratch. This saves hours of configuration time.

What gets copied	You choose what to bring across. You can copy credentials, tools or both. You can select specific items rather than copying everything blindly.
Links between tools	When a tool depends on a specific credential, that connection is automatically recreated in the new workspace so everything still works correctly.
Phone numbers	Phone numbers are not copied automatically. You set them manually for the new workspace, which prevents any accidental overlap with the original.
Invite a new admin	During the copy process you can optionally send an invitation email to a new admin for the cloned workspace, so they are ready to log in straight away.
What this means for you	Onboarding a new client who needs a similar setup takes minutes rather than hours. Proven configurations can be reused reliably without risk of mistakes.

Q

Complete Feature Summary

Phone Calls • Answers every call, day and night • Respects your business hours • Transfers to a human when needed • Sends a written summary after each call	Smart Recognition • Identifies callers by phone number • Greets known callers without asking • Understands names and booking numbers • Asks smart questions when unsure	AI Capability • Speaks multiple languages • Choice of natural-sounding voices • Takes real actions during calls • Custom context and personality	Call Records • Full transcripts saved automatically • Audio recordings stored per call • Duration, cost and AI analysis • Searchable and filterable logs
External Connections • Connects to any web-based system • Four secure credential types • Test tools before going live • Real-time lookups during calls	Team • Email-based invitations • Three levels of access • Activate or suspend access • Safe self-management controls	Security • Encrypted login tokens • Role-based permissions • Verified incoming signals • Request limits and validation	Administration • Manage multiple organisations • Copy workspace to onboard clients • Platform-wide statistics • Drill into any organisation
